The Span Between Intelligence and Human Experience

Accountable intelligence — systems you can inspect,
memories you can trust, machines that show their work.

THE PROBLEM

The black box era is over.

AI models are interchangeable. They change under you.
Every answer comes from a box nobody can open.
No record of what was believed. No reason why. No accountability.

You can't build civilization on a machine that can't show its work.

THE THESIS

“I turn the black box into a plexiglass one.”

Every decision carries its record: what was believed, how strongly, when — and what came before. Inspectable by design. Not by promise.

THE SCIENCE

A third clock for machine memory.

Tick time. Event time. And knowledge time — when the system itself knew things.

The Tritemporal Field Law: validated, published, timestamped.
8/8 pre-registered predictions hit. 1,000+ researchers reading.
DOI 10.5281/zenodo.23198458

Memory as an attractor in a pressure landscape — not a row in a database.

THE MECHANISM

The event field.

Every event leaves pressure. Pressure shapes the landscape.
The landscape pulls attention. Attention becomes behavior.

Memory is not a row in a database —
it is an attractor in the pressure landscape.
The things attention cannot escape.

THE ASSEMBLED MACHINE

ARCHETRON

SEVEN JOBS · ONE ARCHITECTURE

Observe · Know · Attend · Learn · Govern · Act · Account

Each job performed by one or more VOLSHi systems.
Together, the larger machine. The parts become a system.
